In an exercise of unusual miniaturization, the Micro Shaper profiler is born to define and project light with precision, versatility, and maximum attention to detail. Its operation is based on the successive refraction of light through a set of lenses, ensuring the highest definition of the generated beam and providing the possibility to shape it by creating various geometric forms (circular, triangular, as well as other polygonal variations). Depending on its optics, one can choose between a fixed 52° opening or a variable diameter opening from 18 to 34°, achieving light beams of different proportions.
